LPM Smart Tools Quick-Controller

Gives you peace of mind for an unsupervised production of small and medium subjects

Easy control measurements and less sorting and waste

Think smarter in the production

By using the Quick-Controller, the amount of time spent by an employee in the production is minimised, and the time spent in sorting and verifying the subjects in case of detected errors is significantly reduced right down to one sixth.

This is made possible by automatically splitting a production into six smaller batches in removable collection boxes.

Additionally, two or three subjects from each of the six batches are extracted and put into separate test drawers. Hereby, it is easy to ascertain in which part of the process an error has occurred, and if it is consistent. This way time you save time on unnecessary sorting and you avoid discarding an entire production.

Furthermore, the Quick-Controller is the optimal tool to ensure that your company is able to combine high quality and a high level of documentation with competitive prices and low costs. This is achieved because the Quick-Controller is capable of running

SPC (Statistical Process Control) with bigger uptime on the machines. The work piece from the test drawer becomes the work piece of which every new piece is measured by. By this, it is possible to run six SPC-measurements without stopping the machines every time. Bigger uptime with the same high quality and documentation - that is what it takes to be competitive in the market and make sure your company stays on top.

It is also possible to purchase an underframe on wheels and with the option of adjusting the height.

LPM Smart Tools

Smart Tools is based on a simple principle - Think smarter in the production.

Our developer's unique combination of practical experience, technical knowledge and ingenuity has been essential in the creation of the Smart Tools-series.

Smart Tools saves time in the production and increases the efficiency.
